#### IMPLICATIONS OF REGIONAL PRODUCED WATER USE IN CRUDE PRODUCTION WATER FOOTPRINT

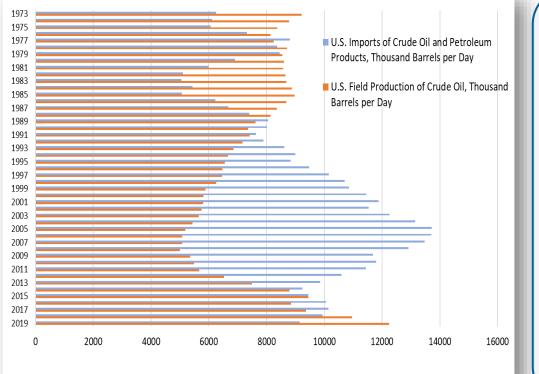

#### MAY WU

Argonne National Laboratory

Water Reuse: Research Showcase Sept. 28-30, 2020

## INTRODUCTION

FARTMENT OF IERGY Argonne National Laboratory is a U.S. Department of Energy laboratory managed by UChicago Argonne, LLC  Domestic crude oil production from onshore wells grew steadily for more than a decade.

- Increased from 3466 thousand bl/d (2005) to 7660 thousand bl/d (2017).
- The production accounts for 44% of total supply in 2017, doubled that of 2005.
- Crude imports decreased during the period from 10.1 million bl/d to 7.9 million bl/d.

Argonr

#### WATER MANAGEMENT IN PETROLEUM PRODUCTION

- The production of petroleum involves substantial water and wastewater in multiple stages. The water use is closely related to and affected by technology advancement and management programs and constraint by regional characteristics.
- A change of crude sources and the proportion of total supply would bring changes in water management and potentially shift the overall water footprint of the petroleum products.
- Produced water is a non-conventional water resource and a key feature in the water footprint of petroleum production.

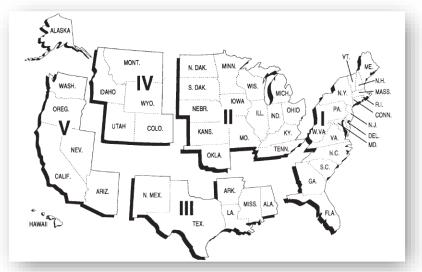

# SCOPE

- Examine produced water management in the conventional crude production from onshore wells.
- Adopt a water footprint approach.
- Conduct national and regional analysis.
- Develop analysis based on surveys, published literature, and various inputs from industry.

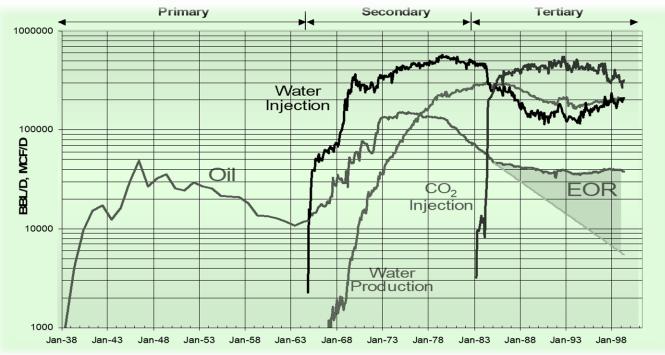

Understand the impacts of production dynamics, management practices, and regional characteristics on water use.

#### PRODUCTION TECHNOLOGY BASED WATER FOOTPRINT

## FATE OF PRODUCED WATER FROM U.S. OIL RECOVERY

Nationally, produce water re-injection for enhanced oil recovery decreased from 71% in 1995 to 46% in 2012 while injection for disposal doubled during the period.

## PRODUCED WATER-TO-OIL (PWTO) RATIO

- Significant regional variations in PWTO.
- The range of PWTO widens over time.
- PWTO changes over time.
  - The ratio for PADD IV increased about three-fold from 1995 to 2012.
  - Those of PADDs II and I decreased by a half and more than 90%, respectively, over the same period.

#### SHARES OF PRODUCTION AND WATER USE IN PADD REGIONS

# CONCLUSION

- Produced water management that emphasizes water reuse and recycle drives a sustainable water footprint for crude production.
- PWTO in PADD regions widened in last two decades and ranged from 0.7 – 25.4 in 2012.
- The degree of produced water reinjection for oil recovery has significant impact on the net water footprint.
  - Wells that with modest to large PWTO can lower net water use by increasing PW reinjection when feasible.
- The type of recovery technology and the production share in a region play an equally critical role in the national net water footprint.
