Legal Framework Water Rights

California Constitution Article X, Section 2 and State Water Code require that all water belongs to the state and that all water use be both "reasonable and beneficial" and not wasted

Surface Water

- **1914** – surface water permitted
- **Riparian** – land touches water source – part and parcel
- **Appropriative** – first in time - use away from point of diversion
 - Pre-1914 – no permit required
 - Subject to loss for nonuse
- **Prescriptive** – acquired thru adverse possession of another's water right – court awarded

Groundwater

- **2014** – SGMA
- **Correlative** – landowners have right to install well and start pumping
- **Appropriative** – first in time - use away from point of diversion
 - Pre-1914 – no permit required
 - Subject to loss for nonuse
- **Prescriptive** – acquired thru adverse possession of another's water right - court awarded

Legal Framework Sustainable Groundwater Management Act

Basins Groundwater Basin Prioritization Summary

Basin	Basin area (sq miles)	Population (2010)	Percentage of total basin area	Percentage of total population
High	43	69%	47%	
Medium	84	27%	47%	
Low	27	3%	1%	
Very Low	861	1%	1%	
Total	1015	100%	100%	

Basin Prioritization study - June 2, 2014

Prioritization

- Population and Density
- Current and Projected Growth
- Number Public Supply Wells
- GW Reliance
- Other adversity including GDEs

Critically Overdrafted Basins

Basin Number	Basin/Subbasin Name
2-41	San Joaquin Valley
2-42	Yuba Valley

11

12

Legal Framework Sustainable Groundwater Management Act

Define how sustainability will be set and measured

- 1) *Undesirable Results* – qualitative description of what is unacceptable
- 2) *Measurable Objective* – quantitative metric of desired condition
- 3) *Minimum Threshold* – quantitative metric where undesirable results becomes significant and unreasonable and action is taken

For All Pertinent Sustainability Indicators:

11/12/20

13

13

Legal Framework Sustainable Groundwater Management Act

Legislative Intent that:

- Groundwater basins be locally managed, that groundwater is a local resource
- Groundwater storage be increased statewide and remove unnecessary impediments to recharge

Groundwater Sustainability Plan Regulations require that GSPs contain the following:

- Description of conjunctive use programs
- Recharge area maps
- Identification of potential recharge areas and discharge areas (springs, seeps, wetlands)

And that GSAs report:

- Surface water supplies used or available for use for recharge to be reported on annual basis
- Water budget inputs and outputs

11/12/20

14

14

Legal Framework Sustainable Groundwater Management Act

Next Steps

- COD Basin GSPs were submitted in January
 - DWR has two years to review and comment
 - COD Basin GSAs are implementing GSPs
- Litigation has been filed challenging SGMA and GSPs
- Remaining SGMA basins are preparing GSPs, due January 31, 2022

11/12/20

15

Legal Framework Sustainable Groundwater Management Act

Critically Overdrafted Basin Groundwater Sustainability Plans (TAF/year)

- Most have mixed portfolios, but recharge is the major management action, few incentives for demand side management
- Most do not have shallow well protections
- Many allow continued significant subsidence

47% Augmenting supplies		33% Shifting surface water use		20% Managing demand	
957 Recharge		254 Surface water trading	241 Conveyance	228 Land fallowing	
43 Reclaimed water		147 Surface water treatment	91 Recycled water	179 Pumping restrictions, etc.	
40 Surface storage				49 Urban conservation	11 IE
Total amount: 2,241 taf/y

11/12/20

16

Legal Framework Policies, Statutes, Regulations, Affecting MAR

2020 Water Resiliency Portfolio

- Streamline recharge efforts
- State funding for recharge
- Technology for mapping recharge areas

State Water Boards-Water Quality

- Porter Cologne (Water Code §13000)
- Basin Plans
- Irrigated Lands Regulatory Program (ILRP), Dairy Program
- Drinking Water Policy (Resolution 88-63)
- Water Code §2100

State Regulations and Permitting

- Underground Storage Supplement
- Recycled Water Policy
 - Recharge Wells using Recycled Water
 - Infiltration Basins using Recycled Water
- General Waste Discharge Requirements for ASR that Inject (Chlorinated) Drinking Water
- Streamlined Stormwater Permitting for Recharge

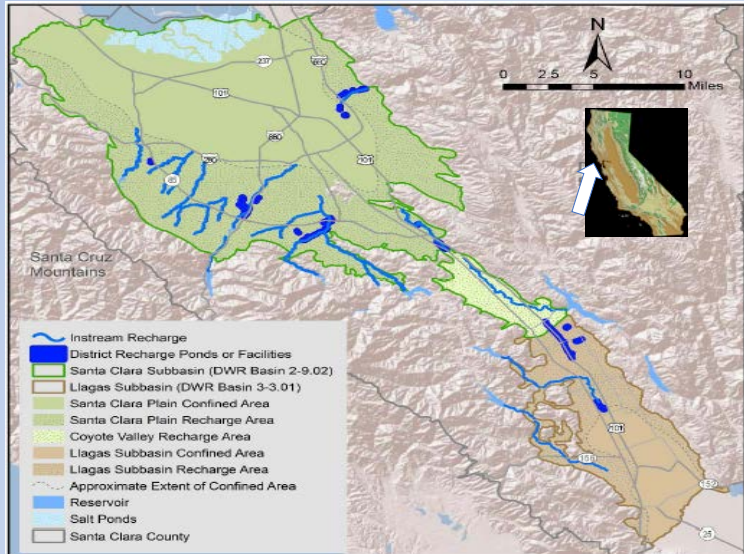

11/12/20

17

17

Long-Term MAR in California Santa Clara Valley Water District

- Established in 1930s to address land subsidence and associated flooding from San Francisco Bay
- Land subsidence about 13 feet in San Jose between 1915-1970
- 393 acres of recharge ponds
- 91 miles of controlled in-stream recharge
- Recharge approximately 100,00 acre-feet per year

11/12/20

18

18

Long-Term MAR in California Santa Clara Valley Water District

- Approximately half the supply comes from groundwater
- Direct and in lieu recharge
- Sources of water include stormwater water, recycled water and imported water

11/12/20

19

19

Long-Term MAR in California Leaky Acres – City of Fresno & Clovis, Fresno Irrigation District

- Initiated in the 1970s to address falling groundwater levels
- Clovis – 85-acre recharge basin
- Fresno – 224 acres of recharge ponds
- Fresno Flood Irrigation District operates 700-mile canal and nearly 600-acres of recharge ponds

11/12/20

20

20

Long-Term MAR in California

Leaky Acres – City of Fresno & Clovis, Fresno Irrigation District

- In the 1930's groundwater was as shallow as 30 feet bgs, but now more on the order of 150 feet bgs
- Approximately 60,000 acre-feet/year recharged
- An additional 20,000 acre-feet stormwater recharged through Flood Control District recharge basins
- Recycled water use has also been increased for supplemental use, and not is over 25% of water supply in Clovis and 15% in Fresno

11/12/20

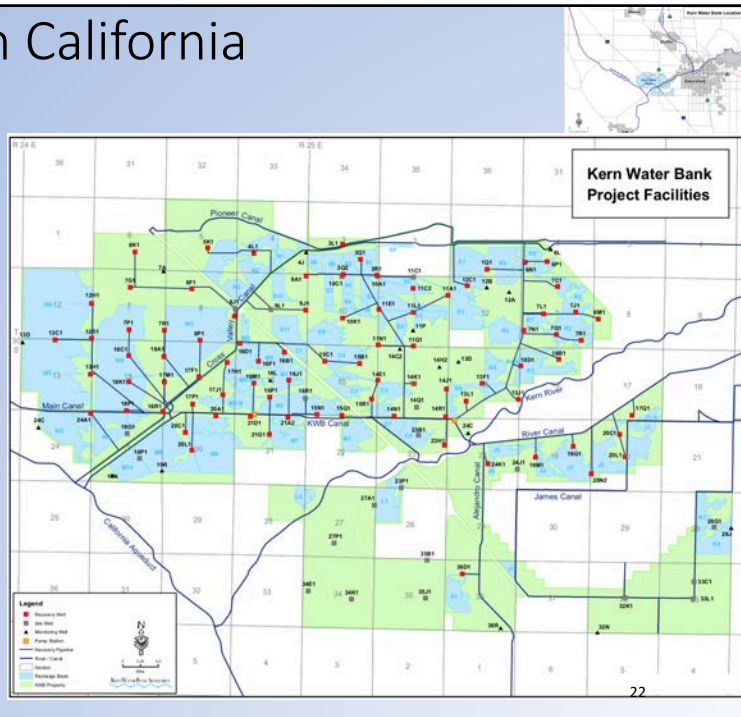

21

21

Long-Term MAR in California

Kern Water Bank

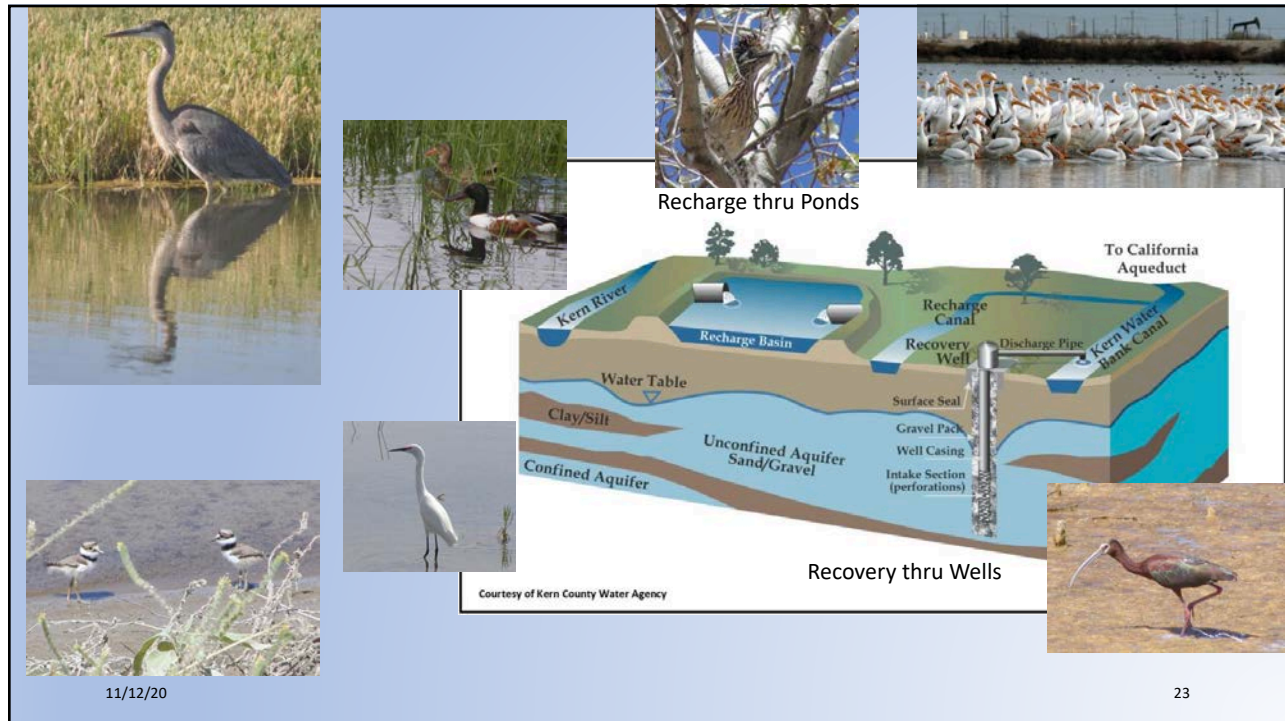

- Established in 1988 by the State – 1994 thru Monterey Agreement became a separate non-state entity
- 20,000 acres of state and federally designated habitat
- Habitat conservation plan /natural community conservation plan
- Bank capacity ~10MAF
- 7,000 acres recharge ponds – recharge rate 0.3 ft/day
- 85 recovery wells – 5 cubic feet/sec
- 36 miles pipeline
- 6-mile canal
- Recharge more than 2.5MAF and recovery 1.5 MAF annually

11/12/20

22

22

11/12/20

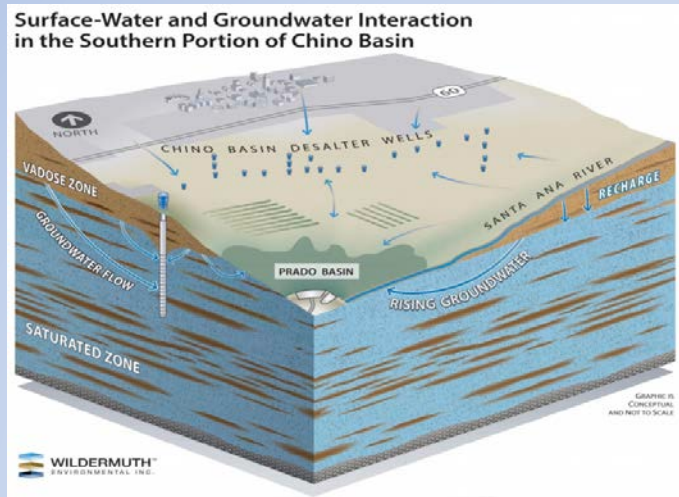

23

23

Long-Term MAR in California Chino Basin Desalter Authority (CDA)

- CDA formed in 2001 under Joint Powers Agreement - 8 agencies
- CDA purifies brackish water extracted from the lower Chino Basin with the Chino I and II Desalter facilities and distributes drinking water to its member agencies
- Primary contaminants in the brackish water treated include nitrate, total dissolved solids (TDS), and volatile organic chemicals (VOCs) Nitrate and TDS contamination a result of agricultural and dairy operations in the southern portion of the Chino Basin
- A primary reason for the desalters is to lower the groundwater level and prevent contaminated water from entering the Santa Ana River and flowing to Orange County (Hydraulic Control)

11/12/20

24

24

Long-Term MAR in California Chino Basin Desalter Authority (CDA)

- Groundwater Production
 - 29,000 Acre Feet/Year by 22 Wells
- Treated Water - 24,600 Acre Feet/Year
- Two Desalters (22 million gallons/day (mgd) capacity)
 - Chino I – Constructed by SAWPA (2000)
 - Reverse Osmosis/Ion Exchange/Air Stripping
 - Chino II (2006):
 - Reverse Osmosis/Ion Exchange
- *Reverse Osmosis (TDS & Nitrate removal)*
- *Ion Exchange (Nitrate removal)*
- *Air Stripping (VOC removal)*

11/12/20

25

25

Long-Term MAR in California - WRD

Water Replenishment District of Southern California

- Created by Special Legislation in 1959 to manage, regulate and replenish West Coast and Central Basins
 - 43 Cities
 - Population ~4M
 - ~600,000 AF/Y Water Usage
 - ~250,000 AF/Y Groundwater
 - Over 400 Pumping Wells
- Water Interdependence Now
 - Maximize local stormwater and recycled water for replenishment and resiliency

11/12/20

26

26

Long-Term MAR in California – WRD

WRD Leo J. Vander Lans Advanced Water Treatment Facility

Seawater Barrier Injection

1950's Seawater Intrusion Barrier Testing

STAGE 1 MICROFILTRATION

- Pre treatment before Reverse Osmosis process
- Extends the useful life of the Reverse Osmosis membranes
- Make treatment more efficient
- Filters are the size of 1/100th of a hair

STAGE 2 REVERSE OSMOSIS

- Thin film membrane filters at molecular level
- Only water molecules can go through
- Over 99% of contaminants are removed at this process
- Best available technology for removing contaminants
- Micrometric Level

STAGE 3 DISINFECTION WITH ADVANCED OXIDATION

- Hydrogen peroxide and UV light breaks chemical bonds
- Another layer of disinfection

REMOVES: MOST BACTERIA, FINE PARTICLES, SEDIMENTS

REMOVES: ORGANIC MATERIAL, MOST VIRUSES, PESTICIDES, SALT IONS

REMOVES: PHARMACEUTICALS, VIRUSES, CARCINOGENS, PERSONAL CARE PRODUCTS, INDUSTRIAL ADDITIVES/CHEMICALS

11/12/20

27

27

Long-Term MAR in California - WRD

Facilities owned and operated by Los Angeles County Flood Control District

- Size Both Basins: 1,000 Acres
- Intake Capacity: 2,850 cfs
- Storage Capacity: 5,200 af
- Infiltration Rate: up to 1,200 cfs (2,400 afd)

11/12/20

28

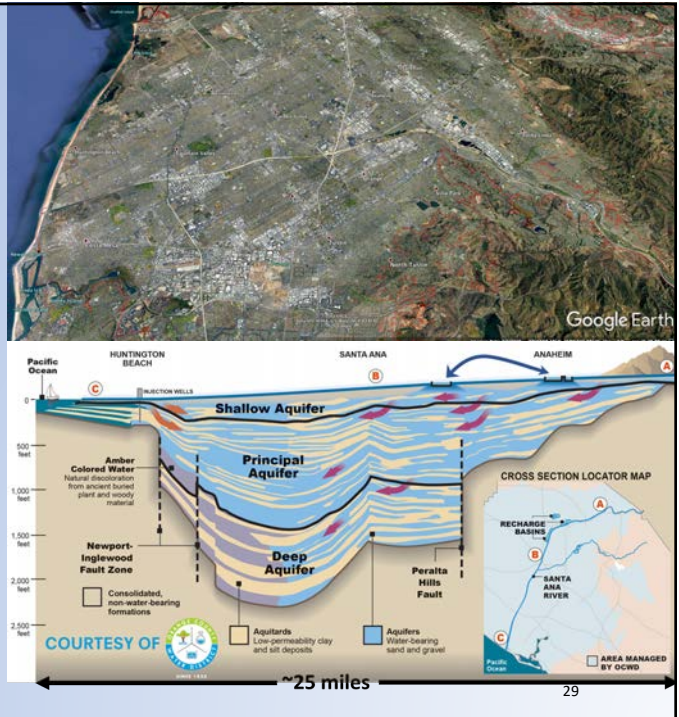

28

Long-Term MAR in California – OCWD

Orange County Water District

- Established in 1933 to
 - Protect rights to Santa Ana River flow
 - Manage OC Groundwater Basin
- Provide groundwater to
 - 19 municipal and sewer districts
 - 2.5 million residents
- Basin provides 77% of the water supply for north and central Orange County, or ~300,000 AF/Y
- Basin capacity ~40MAF

11/12/20

29

Long-Term MAR in California – OCWD

Main Recharge Sources

- River storm flows
- River base flows (largely treated effluent from Riverside and San Bernardino counties)
- Imported water (decreasing supply)
- Recycled water (increasing supply)

OCWD recharge facilities along Santa Ana River. Warner Basin in center/background.
Total Recharge: 250,000- 300,000 AFY

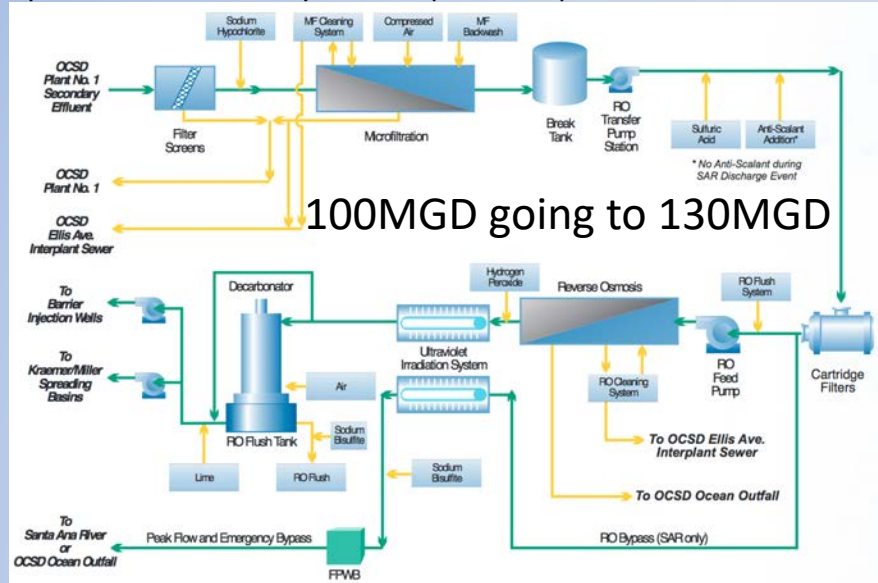

11/12/20

30

30

Long-Term MAR in California – OCWD The Groundwater Replenishment System (GWRS)

- Operating since mid-1990s
- Preliminary/primary treatment – screening, grit chambers, clarifiers, biological sludge treatment
- Microfiltration
- Reverse osmosis
- High intensity ultraviolet light with hydrogen peroxide
- pH adjustment and decarbonation
- Calcium hydroxide stabilization

11/12/20

31

31

Santa Ana River (SAR)

Median Concentrations:

PFOA: 20 ng/L

PFOS: 18 ng/L

PFOA+PFOS: 38 ng/L

- SAR baseflow is dominated by upstream tertiary wastewater discharges
- Occurrence of PFAS in conventionally treated, municipal wastewater is well-established in literature
- PFAS also detected in stormwater runoff to SAR

11/12/20

32

32

Extent of PFAS Impact in OCWD Service Area

Current California DDW NL/RLs:

Notification Levels:
 PFOA = 5.1 ng/L
 PFOS = 6.5 ng/L

Previous Response Level:
 PFOA + PFOS = 70 ng/L

*RL was lowered Feb 2020 to:
 PFOA = 10 ng/L
 PFOS = 40 ng/L

*Public Health Goal (PHG) process has begun

- 11 water retailers (i.e., groundwater “Producers”) in the OCWD service area (up to 71 wells) impacted by 10 ppt PFOA Response Level
- Up to ~ 1/3 of groundwater basin production (100,000 afy) unable to be served
- ~ >\$50 million/year additional alternative water supply cost for treated *imported* surface water

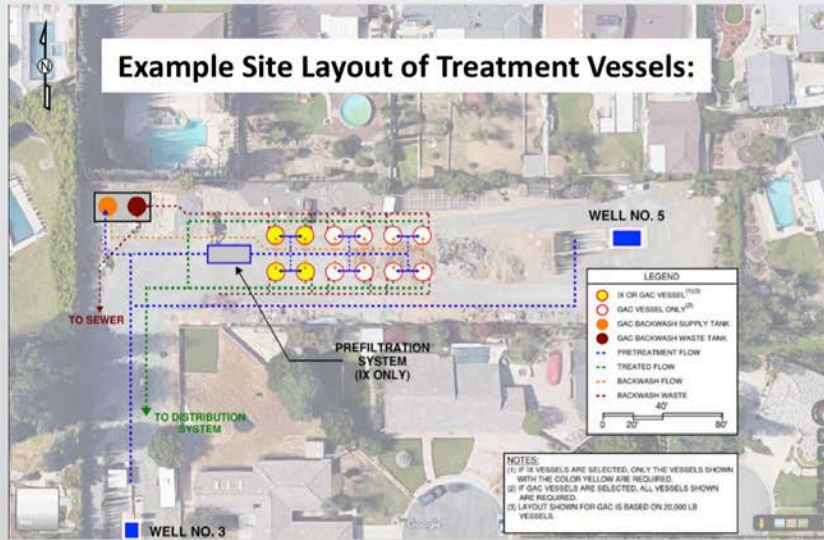

11/12/20

33

33

To Restore our Drinking Water Source – Design of Groundwater Treatment Systems is Underway

- 10 water retailers
- Goal: bring online within 1 to 3 years

11/12/20

34

34

New Developments - MAR in California

FloodMAR

- State recognition that with California’s most highly variable climate in the US, going from droughts to floods, year-by-year, that:
 - Increasing managed aquifer recharge critical
 - Increasing recharge where the most pumping occurs on agricultural lands is the most efficient
 - Challenges to recharge on agricultural land that need to be addressed
 - DWR initiated a process and ensured resources available by partnering with industry to develop the science needed to address the challenges
 - Large group of consultants, academics, agriculture and irrigation districts involved
 - NRCS studies with Terranova Ranch (Grower Don Cameron) in 2010

Flood-MAR Elements

11/12/20

35

35

New Developments - MAR in California

FloodMAR

What’s Needed

- On-farm engineering and costs
- Corp tolerance to flooding
- Apply/enhance recharge suitability mapping
- Assess water quality challenges and solutions
- Consider existing policy and develop the science to support future sound policy decisions for on-farm managed aquifer recharge

Initial Results (Bachand & Associates)

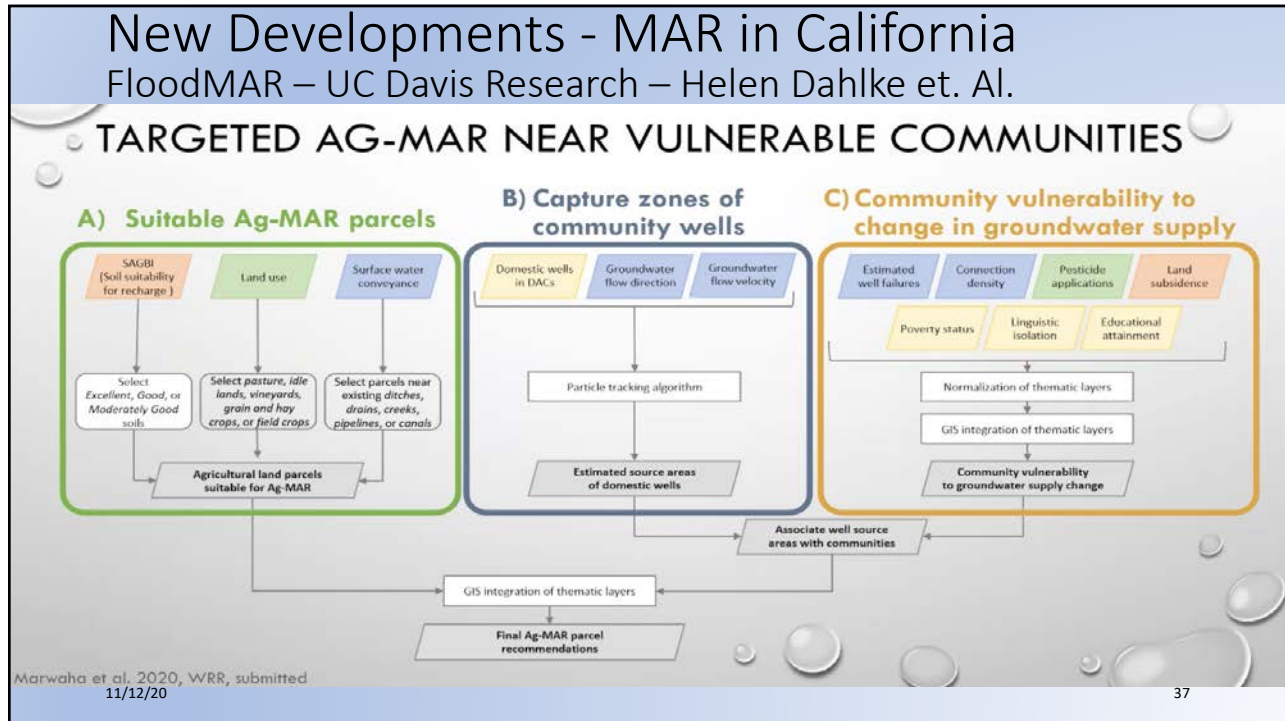

- Typical farm - 0.1% grade = about >3 ft drop over ½ mile
 - Poly pipe and silt fences to dam water
- Periodic and continuous flooding
 - 2-4 inches/day and up to 13 feet total initially
 - Improved 2020 practices up to 12 inches/day and 13-40 feet total
- Water quality - solution flushing of nutrients
 - Tomatoes about 10 times grapes – difference in nutrients needs
 - Flushing over time reduces concentration – sufficiently diluted on one decade

11/12/20

36

36

37

New Developments - MAR in California

FloodMAR – Additional Information Planning Considerations

Policy/Political/Legal

- Local agreements
- Build trust and cooperation
- Water rights
- Water transfers
- Politics
- CA water legacy

(after Bachand & Associates)

39

New Developments - MAR in California

Technologies to Map MAR Suitability – DWR Land Use Viewer

- Over 30 years of state and county land use datasets, as recent as 2014 for statewide – 2016 in QA/QC process and available online
- Land IQ does initial mapping based on a combination of aerial photography, remote sensing multi-spectral imagery, agronomic analysis and ground verification
 - USDA National Agriculture Imagery Program
 - Multiple Landsat 8 images
 - Sentinel satellite-based imagery
 - USGS National Elevation Dataset
 - USDA Crop Data Layer
- Overall mapping accuracy 96.6%, based on 15% overall field data checks performed

<https://gis.water.ca.gov/app/CADWRLandUseViewer/>

11/12/20

40

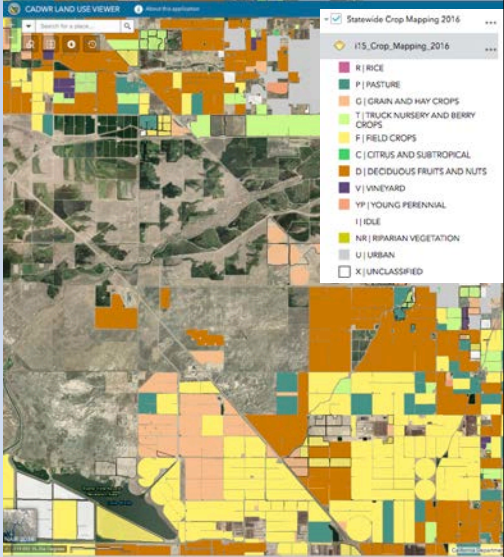

40

New Developments - MAR in California

Technologies to Map MAR Suitability – Annual Statewide Crop Mapping

- Over 30 years of state and county land use datasets, as recent as 2014 for statewide – 2016 in QA/QC process and available online
- Land IQ does initial mapping based on a combination of aerial photography, remote sensing multi-spectral imagery, agronomic analysis and ground verification
 - USDA National Agriculture Imagery Program
 - Multiple Landsat 8 images
 - Sentinel satellite-based imagery
 - USGS National Elevation Dataset
 - USDA Crop Data Layer
- Overall locational mapping accuracy +/- 2m at a 96.6% confidence level, based on 15% overall field data checks performed

41

New Developments - MAR in California

Technologies to Increase Water for MAR – OpenET Platform

- Will make satellite-based data on evapotranspiration -- **a key water metric** -- widely accessible to farmers, landowners, and water managers

<https://openetdata.org/>

In collaboration with

OpenET is scheduled to launch in 2021.

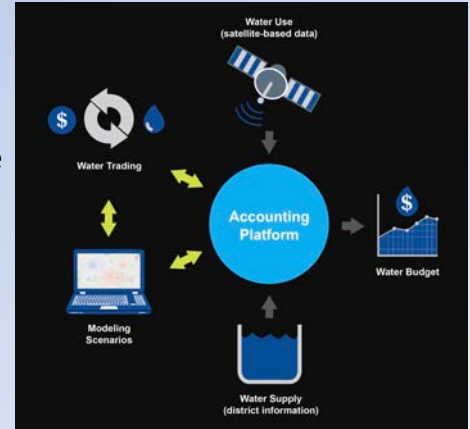

42

New Developments - MAR in California

Technologies to Increase Water for MAR – Water Accounting and Trading Platform

Piloted by Rosedale-Rio Bravo Water Storage District

- Open Platform, Multiple functions
- Water Use – OpenET satellite-based data to calculate evapotranspiration
- Water Budget – combines water supply and use data
 - Water managers can input supply data
- Water Trading – optional add-on function
- Modeling Scenarios – uses Groundwater Evaluation Tool (GET) to analyze options and benefits of different scenarios – links with USGS MODFLOW

47

New Developments - MAR in California

Technologies to Map MAR Suitability – Interferometric Synthetic Aperture Radar

- InSAR uses two or more Synthetic Aperture Radar (SAR) images of an area to identify surface movements through time
- Remote sensing satellites that collect SAR imagery transmit pulses of microwave energy to the Earth's surface and record the amount of backscattered energy
- Use of microwave energy provides an all-weather capability because of its low sensitivity to clouds and rain

<https://www.ga.gov.au/scientific-topics/positioning-navigation/geodesy/>

11/12/20

48

48

New Developments - MAR in California

Technologies to Map MAR Suitability – Interferometric Synthetic Aperture Radar

- State obtaining and analyzing InSAR data, making datasets freely available, to support SGMA program
- InSAR annual data based on water year (Oct-Sept) – also monthly data available
- Over time, results used to identify and measure subsidence related to groundwater extraction
- InSAR data has been ground-truthed with Continuous Global Positioning System (CGPS)
 - More than 1,000 in western US and 100's in CA
 - Generally set up for plate tectonics monitoring
 - [Plate Boundary Observatory/UNAVCO](#)
 - [Scripps Orbit and Permanent Array Center \(SOPAC\)](#)
 - [Central Valley Spatial Reference Network](#)

New Developments - MAR in California

Technologies to Map Snowpack– Light Detection and Ranging (LiDAR) Technology

- LiDAR is flown by plane over high mountain areas mapping:
 - Land surface when no snow present
 - Snow surface when present
 - Snow moisture content measured locally

Summer

Aircraft flies over snow-free mountains and uses laser pulses to measure reflected light bouncing back from the surface.

Laser pulses shot toward ground

Reflected laser light measures distance and is used to create a map of the surface

Winter

Aircraft flies over same area to measure reflected laser light bouncing from snow on surface.

Laser pulses shot toward ground

Reflected laser light measures distance and is compared to summer survey data to show snow depth

50

New Developments - MAR in California

Technologies to Map MAR Suitability – Airborne Geophysics

- Airborne Electromagnetic Method
 - 30 m (~100 feet) above the ground surface
 - 80 km/hr (50 mph)
 - Mapped Denmark where technology developed
 - Typical depths of investigation 1000-1500 feet bgs (300-500 meter bgs)
 - Horizontal resolution 60 m (~200 ft)
 - Vertical resolution ~3 m (10 ft) at surface increasing to ~50 m (160 ft) at 500 m bgs
 - On board sensors/instruments:
 - Electromagnetic
 - Magnetic
 - DGPS
 - Inclinator
 - Laser scanner
 - Ground surface video

11/12/20

51

51

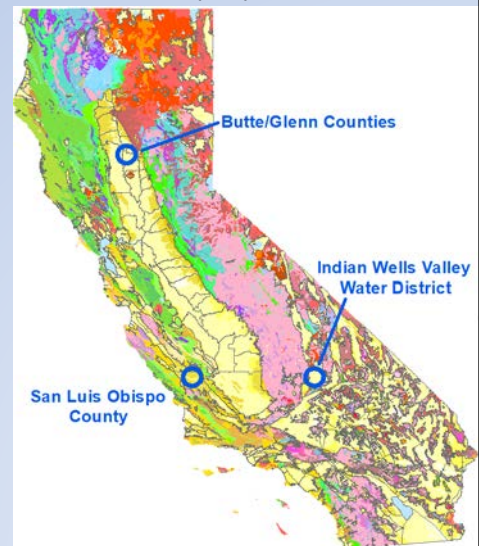

New Developments - MAR in California

Technologies to Map MAR Suitability – Airborne Geophysics

- **Stanford Groundwater Architecture Project**

1. Engage with local agency to identify groundwater management questions
2. Develop the Data Management System
3. Compile existing data
4. Design the AEM survey
5. Acquire the AEM data
6. Analyze the AEM data to obtain the resistivity model
7. Interpret the resistivity models to extract the needed information
8. Integrate all data to generate the conceptual model
9. Answer management questions, acknowledging uncertainty

- **State Request for Proposals to Map SGMA Basins issued October – Selection Pending**

Summary - MAR in California

- California now has a legal framework in place that hopefully will set the course for sustainability
- MAR is a critical element to achieve sustainability, and California has a long history of long-term successful MAR
- State and local provided technology increases the ability and probability of success
- There are many challenges but California has a demonstrated will, investment, and record of success
